

Experiment No.:-7

Aim :- To understand and execute Transaction Control Language (TCL) commands in MySQL.

Step1: Begin a transaction and perform several operations .

```
mysql> START TRANSACTION;  
Query OK, 0 rows affected (0.00 sec)
```

START TRANSACTION: This marks the beginning of a new transaction. All subsequent operations are part of this transaction until a COMMIT or ROLLBACK is performed.

Step2:

Set a savepoint within the transaction. This allows you to roll back to this point if something goes wrong later in the transaction.

```
mysql> SAVEPOINT BeforeUpdate;  
Query OK, 0 rows affected (0.00 sec)
```

Step3: Update a Record

```
mysql> UPDATE Employee SET SALARY = 72000.00 WHERE ID = 11;  
Query OK, 1 row affected (0.01 sec)  
Rows matched: 1 Changed: 1 Warnings: 0
```

Step4: 8. Rollback to Savepoint

```
mysql> ROLLBACK TO SAVEPOINT BeforeUpdate;  
Query OK, 0 rows affected (0.00 sec)
```

Step5: Commit the Transaction.

Save all changes made during the transaction.

```
mysql> COMMIT;  
Query OK, 0 rows affected (0.01 sec)
```
